# EWS ARUBA

Early Warning System Aruba is a project Managed by CMO ARUBA

(Crisis Management Office)

Whereas people-centered in accordance with International Strategy for Disaster Reduction, The Common Alerting Protocol (CAP) is central for Aruba Early Warning System. The Cap System alert message sender can activate multiple warnings with a single input. Through the project with CMO's capability will be improved through CAP- enabled mapping tools, which allow for location specific alerts/warnings based on risk: multi-hazard maps and integrated Voice Alarm and Public Adress (VA/PA) System. Aruba currently has a basic early warning system that, in the event of crisis, will render many persons at risk. To comply with Disaster Risk Reduction, it's time for the development of a comprehensive Multi-hazard EWS, including training and equipment that will improve disaster risk management capabilities.
